TMDB Movie Analysis

By: Molo Munyansanga

Initial Summary

- **Profit**: There was no movie that made less than 1 billion USD of profit.
- **Budget**: It appears that fantasy/sci-fi movies had the highest budget. This is probably due to the extensive use of special effects and CGI.
- **Popularity**: The Avengers movies have been among the most popular and highest rating movies.

Note: The dataset only contained 18 rows, so this may not be representative of the whole movie industry.

Methodology

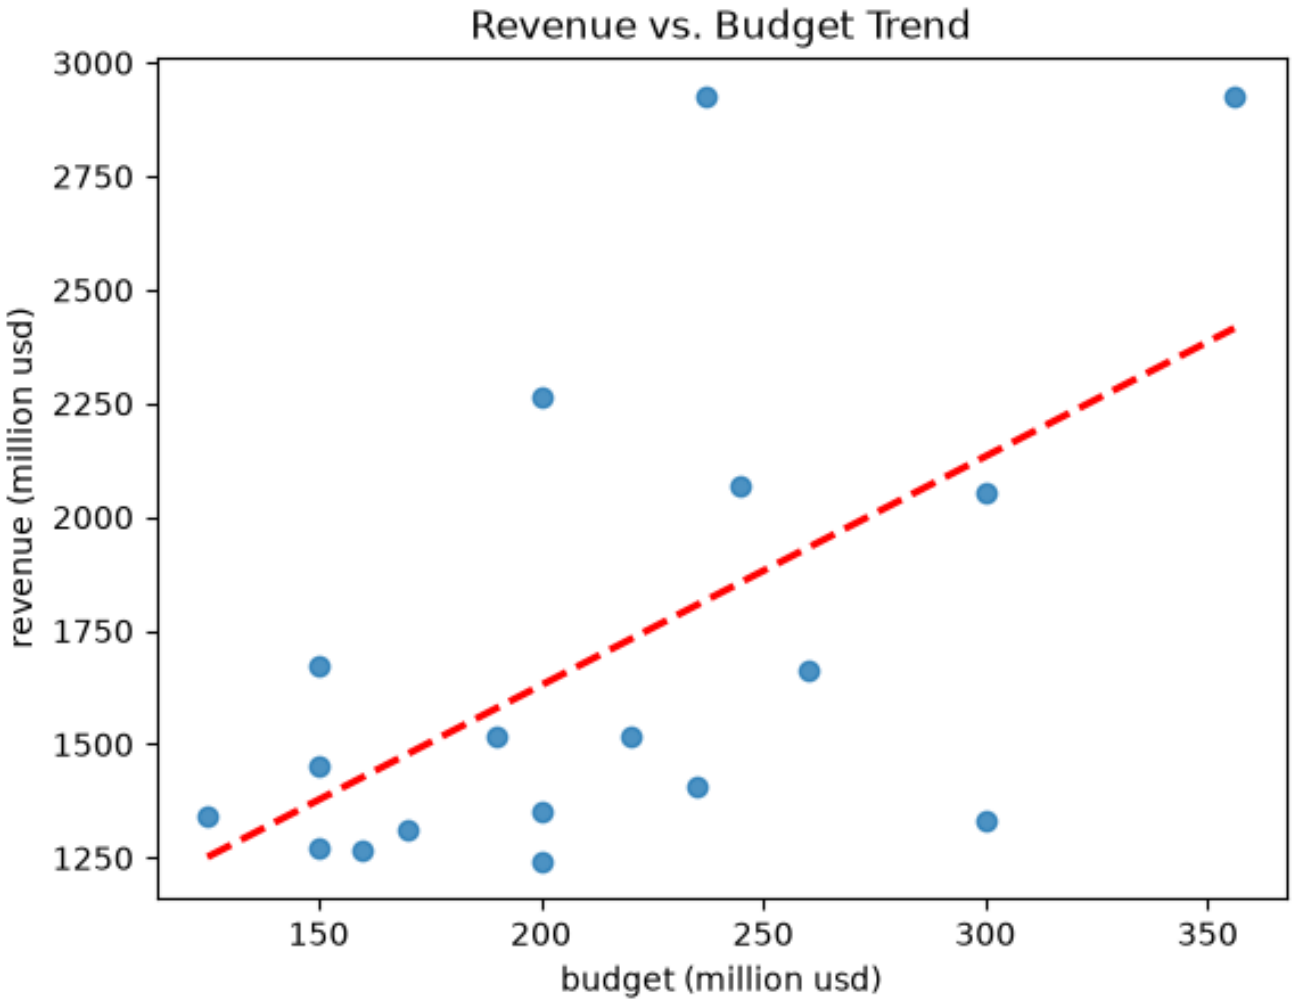

1. **Data Collection**: The project used movie data from TMDb (The Movie Database) API, focusing on a selected dataset of 18 high-grossing movies.

2. **Data Cleaning and Preparation:** Python and Pandas were used to inspect and prepare the dataset for analysis.

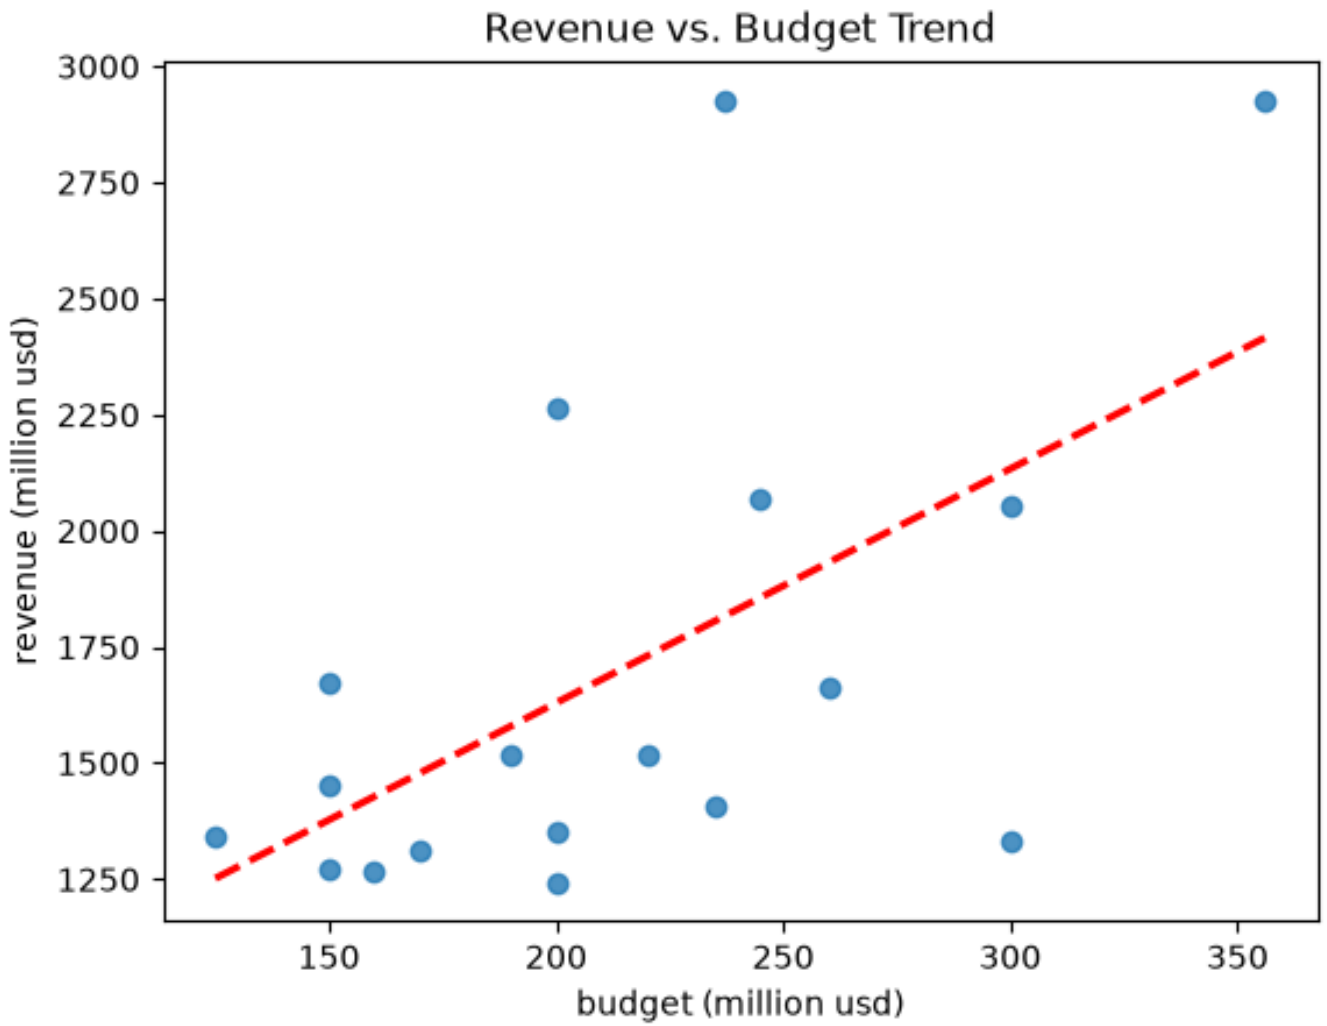

3. **Data Analysis:** The prepared dataset was analyzed using Pandas to identify patterns and compare movie performance.

4. **Data Visualization:** Matplotlib and Seaborn were used to create visualizations, including scatter plots with trend lines, horizontal bar charts, and line charts.

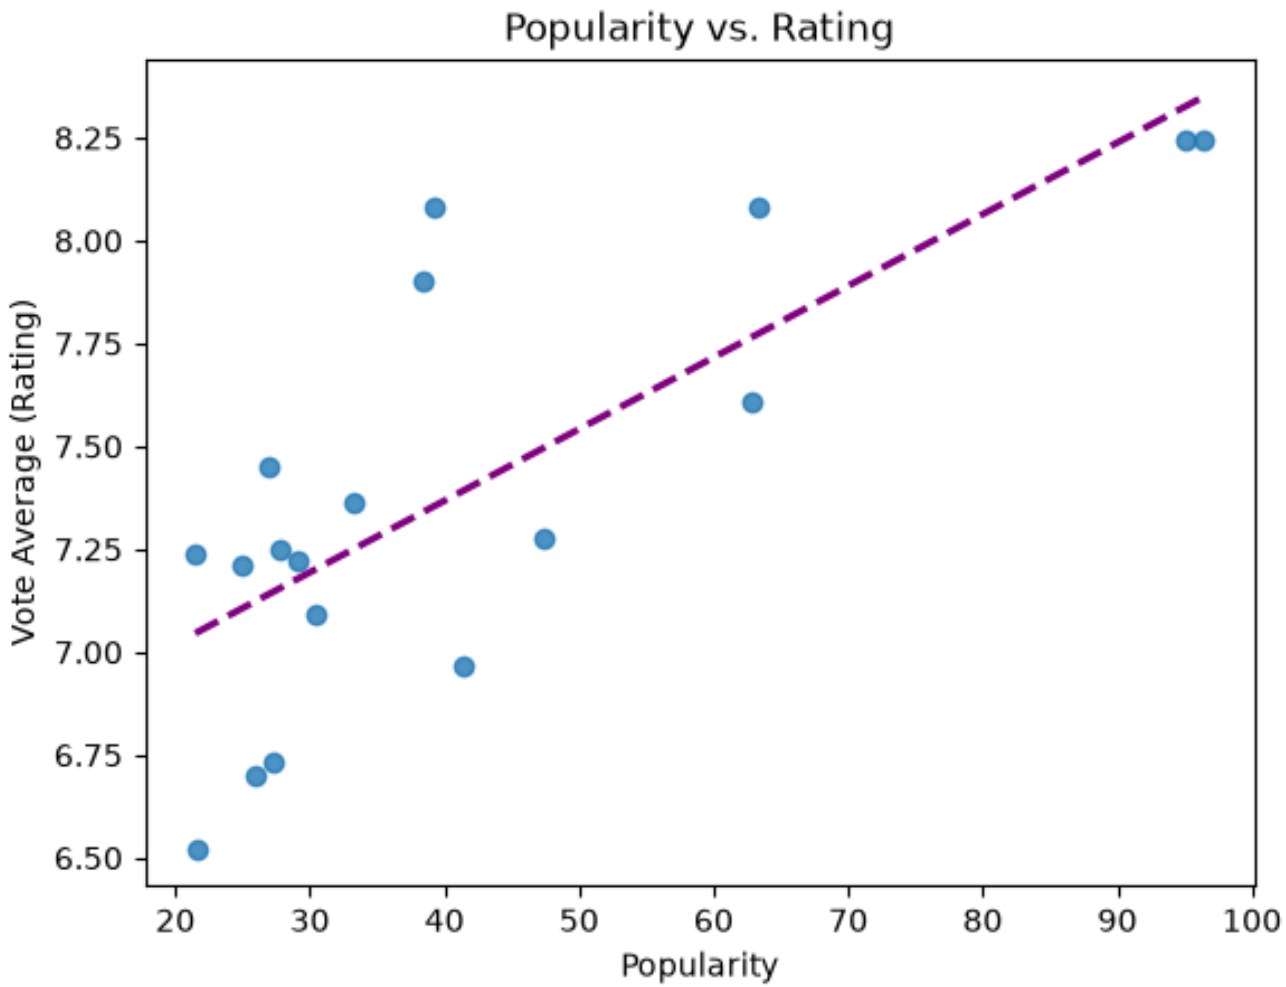

Revenue vs. Budget

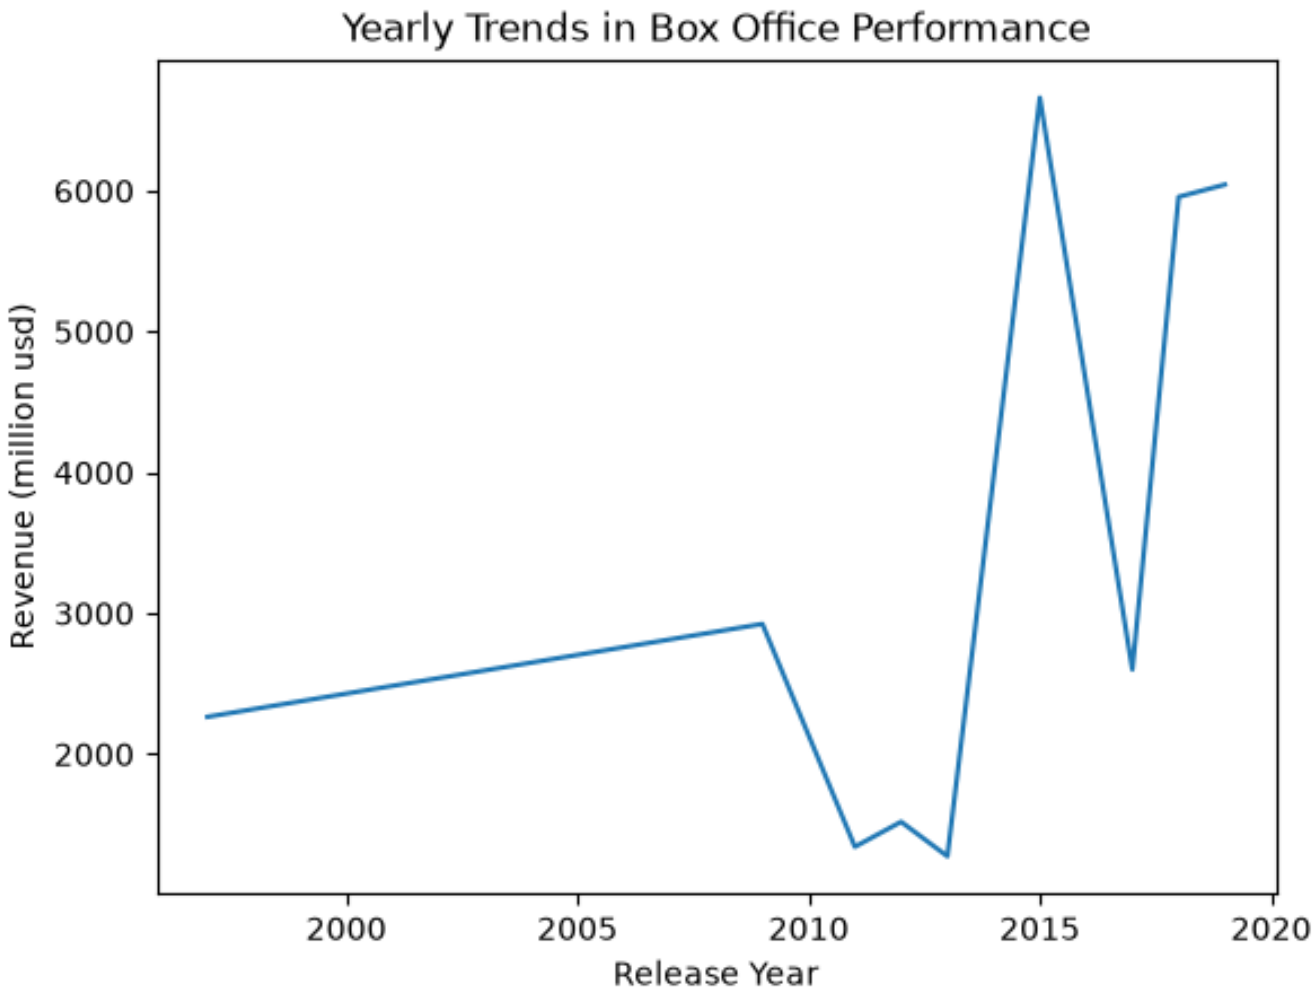

ROI Distribution by Genre

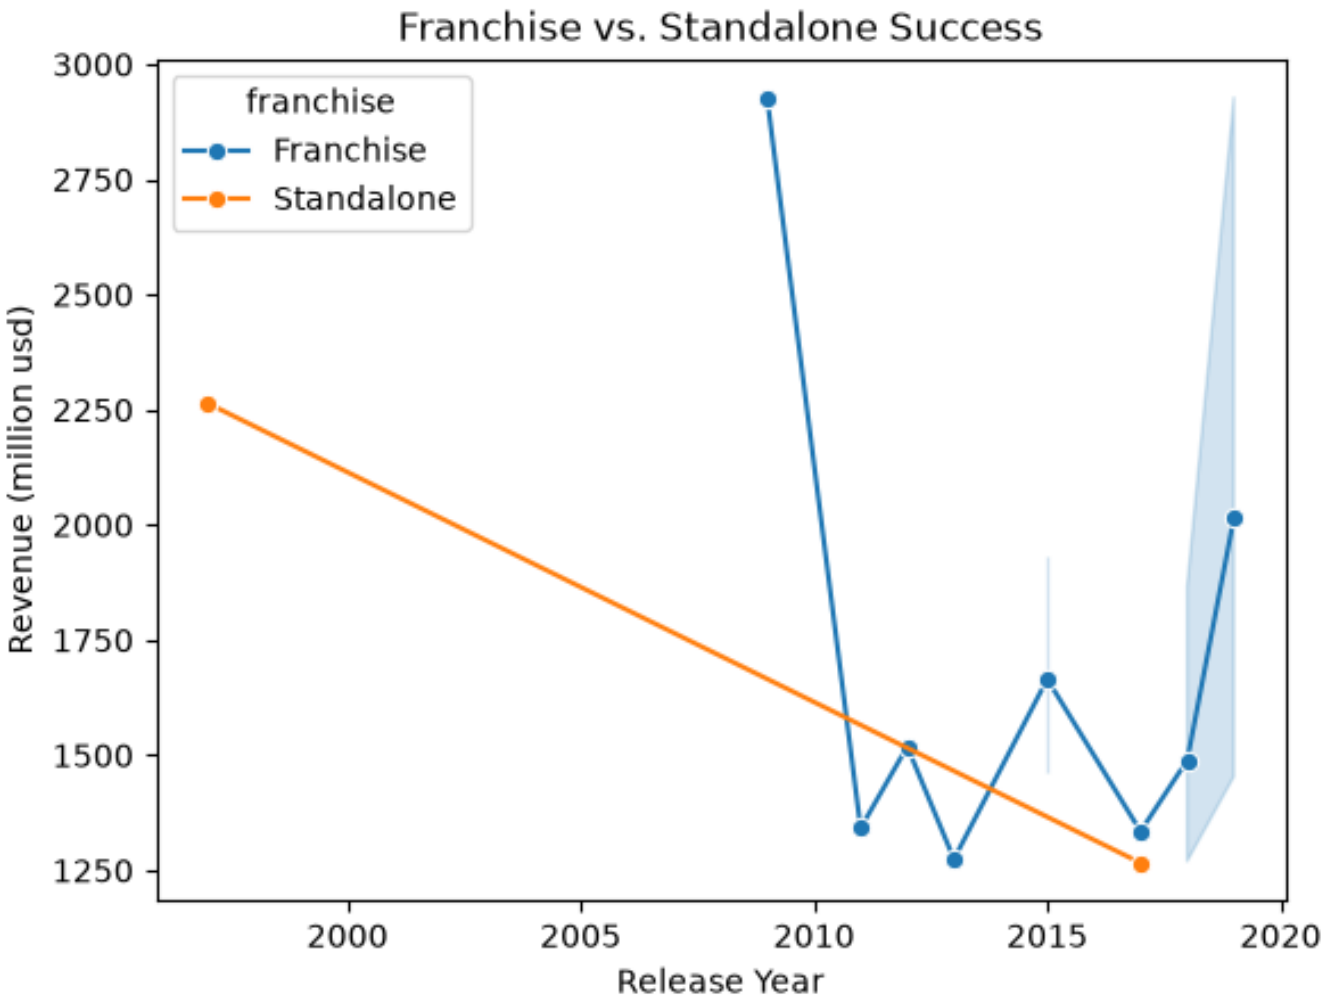

Popularity vs. Rating

Yearly Trends in Box Office Performance

Franchise vs. Standalone Success

Conclusions

1. More data needs to be collected for a more concrete movie analysis.

2. **Titanic** had the second-highest profit, beating movies like **Star Wars** and **Harry Potter**. This is more impressive considering it is not a fantasy/sci-fi movie. A deeper analysis may be needed, in order to figure out how to reproduce this success.

3. It appears more movies that were part of a franchise seemed to do better. This may be an interesting avenue to explore, in order to figure out whether movie franchises will have a higher success rate in the future.
